

Nasiko AI Agent Buildathon: Hackathon Format Document

Theme:

AI Agent Buildathon: Participants will design and build practical AI agents that solve real-world problems and run on Nasiko infrastructure.

Team Structure:

- Team size: 2–4 members

Hackathon Duration:

The hackathon will be conducted in the following format:

- 24-hour sprint format

Hackathon Flow:

Phase 1: Kickoff

- Opening briefing and rules walkthrough
- Introduction to Nasiko infrastructure
- Deployment requirements and guidelines
- Q&A session

Phase 2: Build Sprint

- Teams begin implementation
- Tech support in terms of agent deployment

Phase 3: Submission and Demo

- Final submission deadline
- Project demos by teams
- Evaluation by judges
- Results

Technical Support

Participants will receive structured technical support during the hackathon:

- Deployment guidance on Nasiko infrastructure
- Debug and troubleshooting support

All participants must join the official Discord channel for announcements, support, and coordination.

Communication Channel

All updates, clarifications, and support will be provided through the Nasiko Discord channel. Teams are required to join to remain eligible and informed.

Deliverables (Mandatory Submission Requirements)

Each team must submit the following:

- Public GitHub repository containing the project code
- An agent template has been provided(nasiko infra mail), and participants are required to follow it while building their AI agent.
- A 3-minute demo video explaining the solution and showing the agent in action
- A LinkedIn post describing what the team built, the problem addressed, and how the agent works
- Live deployment on Nasiko infrastructure

Projects that are not deployed on Nasiko infrastructure will be considered incomplete.

Judging Criteria:

Projects will be evaluated using the following criteria:

Goal Satisfaction

How effectively the solution addresses the given problem statement and meets stated objectives.

Code Quality

Code structure, readability, modularity, and engineering best practices.

Agent Performance

Reliability, correctness of outputs, execution quality, and overall agent behavior.

Compliance Requirements

- Teams must adhere to submission timelines
- All deliverables must be complete and accessible
- The deployed solution must be functional at the time of judging
- Code must be original or properly attributed if external libraries are used
